## General information Latching Relays

## E290 Latching Relays

Latching relays are electromagnetically operated devices. They can be used to realise a simple, energysaving and efficient lighting control system.
These devices are mainly used in private houses, factory premises and commercial and public buildings as well as in industrial plants. As a rule, latching relays controlled by means of impulse buttons are installed where it is necessary for lighting to be operated from at least three different places.
Each time a command is initiated (by means of an impulse button), an electrical pulse is applied to the coil of the latching relay. The coil in the device is briefly energised and activated. That short pulse to the coil leads to the mechanical latch of the internal main contacts.
The internal switching mechanism enables us to achieve a safe and reliable interlock (in the same way as a ballpoint pen). Each pulse that is sent to the magnetic coil system switches the device back to its previous position where it is held mechanically until the next control pulse is received.

Therefore the result of a command initiated by means of an external button (e.g. in the corridor) always depends on the current state of the controlled latching relay. If it is switched on, then the next pulse will result in it being switched off (switching sequence: 0-1-0-1-0-..).
Mechanical latching relays are also referred to as "bi-stable relays". That is because they have two mechanically stable contact positions (on or off). In case of a power failure, the last switch position is guaranteed to be held mechanically.

This technology enables to reduce the electrical power loss and current consumption of devices considerably. The extremely low level of switching noise means that latching relays are also suitable for use in public buildings and hotels as well as in private households.
The on/off position can be identified by means of the easily visible and clearly labelled switch lever. Activation can be tested manually by operating the switch lever. The switch position is held mechanically and clearly indicated.

## General information Installation Relays

## E297 Installation Relays

Installation relays are electromagnetically operated miniature contactors in the standard DIN width of 18 mm . A reliable control system can be designed using these installation relays.
They are used mainly in industrial plants but also in commercial and public buildings. As a rule, installation relays operated by means of a control switch (maintained contact) are installed where it is necessary to operate lighting, an air-conditioning system, a fan or suchlike.
Installation relays are also referred to as monostable switching relays or 2-pole miniature contactors.
The term "monostable" means that an on command has to be sent to the coil by means of a control switch (maintained operation) in order to excite the magnetic coil. The coil armature attracts and closes or opens the main contacts. The device remains in the on position for as long as the control voltage is applied to the coil.
If the voltage flow to the coil is interrupted, the installation relay always returns to the neutral position (off position). Installation relays and the accessories are available in different versions in order to easily satisfy the various market requirements.

Their optimal switching capacity also makes them suitable for use in industrial environments and in situations where it is necessary to ensure control over more powerful consumers (such as e.g. multiple lighting systems).
Using an optimized coil (low power loss = lower operating temperature) ensures a clean and safe operation in the electrical distribution board.

The low level of switching noise and the practically hum-free magnetic system mean that they are also suitable for use in public buildings and in private houses.
The current switch position is clearly indicated by the switch lever. The installation relay can be proofed manually for test purposes by operating this switch lever (i.e. without activating the magnetic coil). As soon as the switch lever is released, the relay returns to the neutral position.

# Applications <br> Latching and Installation Relays 

Applications
E290 Latching Relays ..... $2 / 3$
E297 Installation Relays ..... 2/6

## Applications Latching Relays

In an office building, supermarket or other large building complex, latching relays can be used to achieve a flexible, modern and reliable lighting control system for the whole site.

## Application for an E290 Latching Relay:

Each time the impulse button is operated, an electrical pulse is applied to the latching relay that results in a change to the switching state. This state is held mechanically until the next pulse is received.

Switching sequence:
OFF - ON - OFF - ON

The main application for a latching relay is to simply switch various independent lighting areas on and off. Switching from „on" to "off" is carried out by means of a short impulse.
As the device coil of the latching relay is only excited by a pulse for a short time during switching, no additional holding energy is required. The contact position (on/off) is held by means of a mechanical interlock until the next pulse command is sent. In the event of a power failure, the current switch position will always be held. This technology considerably helps to reduce the temperature rise and current consumption of devices operated by magnetic coils, thus saving on unnecessary energy costs.

Example of use within a commercial building

## Applications Latching Relays

## Application for an E290 Latching Relay in conjunction with an E293/X or E294 Central On-Off Control Module:

The interior lighting controlled by means of various impulse buttons can also be operated from a central control point by snapping on a central on-off control module onto the left side of the E290 latching relay.

Switching sequence:

```
Local => OFF-ON
```

Central => OFF - ON
(the central command is the superordinate command)

The combination of a Main device plus central on-off control module can be used to switch multiple lights on and off at the same time without any dependence on the current switch position of the devices. The actual switch position of the various devices (on/off) can be indicated by snapping an auxiliary contact (attachable on the right side) to the control center.
Another possibility would be the combination of an E290 with an E294 central on-off control module for various control voltages. This combination enables for example the cooperation with a PLC (programmable logic controller). Any number of different logical activations in respect of latching relays can be recorded and visualised.

Example of use within an industrial warehouse

## Applications Latching Relays

## Application using an E291S Sequential Latching Relay:

This independent special sequential latching relay switches the contact position in a preset fixed switching sequence.

Switching sequence:
OFF - A - AB - B - OFF

This preset internal switching sequence enables for example the following lighting sequence to be used. As two separate switching circuits are available, lights $A, A B$ and $B$ can be operated individually or together as required. If the button is pressed once or several times (pulse control), the sequential latching relay changes the contact position in the preset switching sequence. An amazingly refined interior or exterior lighting system can be realised with this user-friendly and reliable lighting control option, without any additional installation costs.

Example of use of a Sequential Latching Relay within an exhibition space

## Applications <br> Installation Relays

Because of the individual options for using the installation relays in building management systems, these devices can be used to realise a modern and reliable consumer control system.

## Application for an E297 Installation Relay:

When current is applied to an installation relay, the relay coil attracts one of the main contacts and changes the contact position. The coil of an installation relay has to remain energised in order to hold the contact position. If the voltage is removed from the coil, the installation relay always returns to the off position.

Switching sequence:
OFF - ON

Main areas of application include exterior lighting for office buildings or supermarket car parks as well as other big installations. An extremely flexible and modern lighting control system can be created, using E297 installation relays. Activation can be carried out by means of a twilight switch or a timer but also by means of a simple on-off switch or another electrical control unit. Reliable switching of an exterior lighting system, for example, is realised by sending clear on and off control commands from an external control point. The magnetic coil has to be permanently energised in order for the installation relay to be held in the on position. The energy consumption of the installation relay is reduced to a minimum by the performance-optimised magnetic coil. The low switching noise also makes it suitable for professional use in closed inhabited areas.

Example of use within a commercial building

# Characteristics <br> Latching and Installation Relays 

CharacteristicsE290 Latching Relays3/3E297 Installation Relays ..... 3/7

## Latching Relays and accessories

## E290 Latching Relay

This 18 mm wide DIN rail mounted device is designed for direct installation in main distribution or sub-distribution systems (mounted on 35 mm DIN mounting rails). The devices are activated by means of control pulses and guarantee energy-optimized lighting control. As a rule, installations with latching relays are used where the lighting control system can be operated from at least three points in different locations. Those latching relays are designed for a rated current of 16 A or 32 A .

Standard number of contacts:
1 NO contact, 2 NO contacts or 1 NO contact + 1 NC contact

The number of switching contacts can be increased by a maximum of two main contacts using a snap-on main module (E292-..-..). As a result, up to four lighting sets can be switched by a single device. A signalling and/or indicating facility can be created using the additional snap-on auxiliary contact module (E299-11).
The various standard AC/DC coil voltages complete the comprehensive and interesting product range. The additional devices can be snapped onto the latching relay on the left or right side.

## Control elements $\rightarrow$ Attachable on the left side <br> Switching elements $\rightarrow$ Attachable on the right side

Switching sequence:
OFF - ON - OFF - ON

Safety information
If more than one Latching relay installed next to each other, it is recommended to use a intermediate piece (distance). This guarantees optimal heat dissipation by the main modules. The intermediate pieces ( 9 or 18 mm wide) can be found in the order information as types ZLS725 or ZLS726 (the use depends on the application).

## E291S Sequential Latching Relay

The sequential latching relay is an 18 mm wide device which has two NO contacts. The preset switching sequence for the main contacts enables the switching on and off, of different lighting sets to be "programmed". The E291S has an easily visible switch position display on the front.

Standard number of contacts:

2 NO contacts

Cannot be combined or attached.
"Stand-alone" product.

Switching sequence:
OFF - A - AB - B - OFF

## Characteristics <br> Latching Relays and accessories

## E294 Central On-Off Control Module (for different control voltages)

This 18 mm wide additional control module can be snapped onto a latching relay and has a galvanically separated contact to the standard latching relay. The devices are mechanically connected. Two different control voltage potentials (e.g. AC local; DC central) can be used between the local and the central control point. The E294 central on-off control module is suitable for professional use in control circuits with various configurations. With this snap-on device a priority central command (all off/all on) can be realized.
For this type of solution, a central control mudule needs to be attached for each latching relay integrated in the central on-off control system. Central commands always take priority and reliably switch the mechanically connected coil of the standard latching relay on or off without any dependence on the previous switch position of the individual latching relays. By using a E294/.. central on-off control module at the main module E290, it's not possible to snap on a E292 contact module.

## Control element $\rightarrow$ Attachable on the left side

Switching sequence:
Central OFF - Central ON - Central OFF - Central ON

E293/X Central On-Off Control Module (same control voltage)
An additional control module ( 9 mm wide) which easily snaps onto a latching relay, is used for the same coil control voltages. The central switching on and off of different lighting groups can be achieved quite easily using the E293/X. After the central on-off control module has been snapped on, the devices are mechanically connected. Each latching relay that is provided for a central on-off control system must be provided with an E293/X central on-off control module. Central commands always take priority and reliably switch the mechanically connected coil of the standard latching relay on or off without any dependence on the previous switch position of the individual latching relays. Same voltage potential at central and local control inputs.

Control element $\rightarrow$ Attachable on the left side
Switching sequence:
Central OFF - Central ON - Central OFF - Central ON

## Latching Relays and accessories

E292 Main Contact Module for E290 Latching Relays
The E292 is a 9 mm wide snap-on main contact module. If required, the number of existing main contacts in the standard latching relay can be increased by a maximum of two contacts. The main contact module is available in a 16 A design (e.g. for 3-phase lighting sets).
In the case of 32 A latching relays, it is not possible to increase the number of main contacts!

Standard number of contacts:
1 NO contact + 1 NC contact, 2 NO contacts or 1 change-over contact

## Switching element $\rightarrow$ Attachable on the right side

## E299-11 Auxiliary Contact

The E299-11 auxiliary contact can be used with latching relays and installation relays. The E299-11 auxiliary contact is a snap-on device that enables the individual indication or signalling of the current operating state of the main module (two integrated contacts).

Standard number of contacts:
1 NO contact + 1 NC contact

## Switching element $\rightarrow$ Attachable on the right side

A maximum of two additional snap-on modules can be mounted on the right side of the main device. The additional modules (contact module and/or auxiliary contact) simply snap onto the right side of the main device. Neither additional fixing screws nor additional wiring are required in order to build the various combinations. All additional modules are also easy to remove.

## E295-PS Permanent Signal module

The E295-PS permanent signal module is an add-on module that enables the latching relay to be controlled by means of a permanent signal. After receiving the permanent signal, the latching relay changes its contact position and the coil of the main module is released by the attached permanent signal module at the same time. Without this permanent signal module, the latching relay coil would be permanently energised and valuable energy would be wasted.
When using a permanent signal module, it is not possible to operate manually over the lever on latching relay as the switch lever is covered.
This refined solution is particularly useful if the latching relay is controlled by means of a timer, a twilight switch, a motion detector or another switch with a changeover contact (e.g. a reversing switch, relay, time relay etc.)

Control element $\rightarrow$ Attachable on the left side

## Characteristics

## Latching Relays and accessories

## E295-GM Group Module

The E295-GM group module is an additional module that is also suitable for use in centrally controlled installations. It enables fixed groups of latching relays to be created and controlled which can be combined with the central on-off control system.
For example, various control circuits in an office building can be interconnected. As a result, groups of offices can be controlled by floor or even throughout the whole building using a central on-off control system.
The group module is not subject to any restrictions on the number of control circuits. One group module is required per control circuit.
Suitable for use with standard latching relays as well as in combinations with central contact modules.

## Control element $\rightarrow$ Cannot be attached!

## E296-CP Compensator Module

The E296-CP compensator module is used when illuminated buttons (control points) are used in conjunction with latching relays. The additional module (compensator) enables a higher number of illuminated buttons (inductance) to be connected to a latching relay.
If no compensator module is installed and the glow lamp reverse current is higher than 5 mA , the latching relay may be activated unintentionally. In order to prevent this, an additional compensator must be implemented.

## Control element $\rightarrow$ Cannot be attached!

Maximum number of illuminated buttons per main device (with 0.6 mA glow lamp)

|  | Latching relay |  | Central ON/OFF, same potential |  | Central ON/OFF, different potential |  |

|  | 1 \& 2 contacts | 3 \& 4 contacts | 1 \& 2 contacts | 3 \& 4 contacts | 1 \& 2 contacts | 3 \& 4 contacts |
| without compensator | 8 | 9 | 8 | 10 | 12 | 10 |
| with 1 compensator | 18 | 22 | 27 | 20 | 21 | 20 |
| with 2 compensators | 45 | 38 | 43 | 48 | 58 | 48 |

## Characteristics <br> Installation Relays and accessories

## E297 Installation Relay

The E297 installation relay is an electromechanical switching device controlled by means of a continuous pulse. The coils have a low level of switching noise, are optimized for low power loss and therefore ensure safe and fault-free use in various applications. Either AC or DC control voltage can be applied. The installation relay is designed for a rated current of 16 A .

Standard number of contacts:
1 NO contact, 2 NO contacts or 1 NO contact + 1 NC contact

In addition, the number of main contacts can be increased to four contact lines using the snap-on E298 Main contact module so that three different groups of loads can be switched and controlled safely. The various AC/DC coil voltages complete the comprehensive and interesting product range. The additional devices can be snapped onto the installation relay on the right side.

## Switching element $\rightarrow$ Attachable on the right side

Switching sequence:

## OFF - ON - OFF - ON

Safety information
If more than one Latching relay installed next to each other, it is recommended to use a intermediate piece (distance). This guarantees optimal heat dissipation by the main modules. The intermediate pieces ( 9 or 18 mm wide) can be found in the order information as types ZLS725 or ZLS726 (the use depends on the application).

## E298 Main Contact Module for E297 Installation Relays

The E298 is a ( 9 mm ) snap-on module with integrated main contacts. As the E297 main module has a maximum of two main contacts, the number of main contacts can be increased to four contact lines using the main contact module (e.g. for 3-phase lighting sets).

Standard number of contacts:
1 NO contact + 1 NC contact, 2 NO contacts or 1 change-over contact

Switching element $\rightarrow$ Attachable on the right side

## Characteristics

Installation Relays and accessories

## E299-11 Auxiliary Contact

The E299-11 auxiliary contact can be used with installation relays and latching relays. The E299-11 auxiliary contact is an additional snap-on device that enables the individual indication or signalling of the current operating state of the main module.

Standard number of contacts:
1 NO contact + 1 NC contact

## Switching element $\rightarrow$ Attachable on the right side

A maximum of two additional snap-on modules can be mounted on the right side of the main device. The additional modules (contact module and/or auxiliary contact) simply snap onto the right side of the main device. Neither additional fixing screws nor additional wiring are required in order to complete the combination. All additional modules are also easy to remove.

# Possible mounting variations <br> Latching and Installation Relays 

Possible mounting variationsE290 Latching Relays4/3E297 Installation Relays ..... 4/7

## Possible mounting variations Latching Relays

## E290 Latching Relay

## Safety information

If more than one Latching relay installed next to each other, it is recommended to use a intermediate piece (distance). This guarantees optimal heat dissipation by the main modules. The intermediate pieces ( 9 or 18 mm wide) can be found in the order information as types ZLS725 or ZLS726 (the use depends on the application).

## Possible mounting variations Latching Relays

E290-16-10 + E299-11 - Latching Relay with Auxiliary Contact

Application at a normal light control via different push buttons (PB);
The snapped-on auxiliary contact (E299-11) displays the current switching state of the light control (ON/OFF).

E290-16-10 + E292-16-11 + E299-11 - Latching Relay with Auxiliary Contact

Latching Relay E290 with attached contact module E292-16-11 (additional main contact tracks) plus an auxiliary contact to externally display the switching state of the main contacts (ON/OFF).

E290-16-10 + 295-PS - Latching Relay with permanent signal module

This combination permits control of the E290 coil via a permanent signal (e.g. directly controlled by a timer or a twilight switch). When using this accessory, manual switching at the main unit is not possible.

## Possible mounting variations Latching Relays

E290-16-10 + E293/X - Latching Relay with Central Control Module

The function of a Central ON/ OFF control is implemented by using the accessory E293/X. The E293/X Central ON/OFF module uses the same coil voltage potential as the main unit E290.
The light control can be either on site via the local buttons, or by the Central ON/OFF button.

E290-16-10 + E294/230 - Latching Relay with Central Control Module

This is a second possibility to implement a Central ON/OFF control. When a E294/... accessory is snapped on, this Central ON/OFF device uses a different voltage source for coil control. The light control can be performed locally on site via the regular button.
The Central ON/OFF button permits a general switching state change from a central location.

$\mathrm{E} 296 \mathrm{CP}+\mathrm{E} 290-16-10+$ E299-11 - Latching Relay with Auxiliary Contact plus Compensator

The compensator E296CP is used every time a certain number of lit local buttons is exceeded. See table in the catalogue, page 3/6.

## Possible mounting variations Latching Relays

E290-16-10 + E293/X + E295GM - Latching Relay with Central Control Module and Group Module

Central control module + Latching relay

Central control module + Latching relay

Central control module + Latching relay

An example of a central ON/OFF control E290 with E293/X combined with Group Modules E295-GM; The Group Modules are integrated into the control to be structured into different light area groups. The on-site local buttons permit individual control of each Latching Relay. The Integration of the Group Modules into this control permits a distribution into two groups. Pushing the button "Group ON/OFF" permits individual switching of each group. The general button "Central ALL ON/OFF" can put the switching state of all E290 devices into the desired position (ON/OFF).

## Possible mounting variations <br> Installation Relays

E297 Installation Relay

## Safety information

If more than one Latching relay installed next to each other, it is recommended to use a intermediate piece (distance). This guarantees optimal heat dissipation by the main modules. The intermediate pieces ( 9 or 18 mm wide) can be found in the order information as types ZLS725 or ZLS726 (the use depends on the application).

## Possible mounting variations Installation Relays

E297-16-20 + E298-16-11 - Installation Relay with Contact Module

Light control via an Installation Relay E297 with connected Contact Module E298-16-11 (additional main contacts) to externally signal the switching state of the main contacts (ON/ OFF).

E297-16-10 + 299-11 - Installation Relay with Auxiliary Contact

Application with a normal light control via an ON/OFF switch. The current condition indication of the light control (ON/OFF) is implemented, e.g., in the distribution board, with the help of the auxiliary contact (E299-11).

E297-16-20 + E298-16-11 + 299-11 - Installation Relay with Contact Module and Auxiliary Contact

Combination of an installation relay E297 with an attached Contact Module E298-16-11 (additional main contacts) plus an Auxiliary Contact to clearly indicate the switching state of the main contacts (ON/OFF).

Due to possible changes in regulatory requirements and materials, the characteristics and dimensions stated in this catalogue are only to be considered as binding after confirmation from $A B B$.

[^0]:    ${ }^{2)}$ See overview of chapter 4 on 4/7
    ${ }^{3)}$ Coil supply voltage:
    All E297 devices can be supplied with AC or DC control voltage. The ratio of $1: 1$ is to be heeded, i.e. a 48 VAC coil can also be used for 48 VDC.
